SUMMARY

Computer Science student at UC Irvine with hands-on experience in full-stack application development, software testing, and cross-stack debugging. Worked across frontend and backend systems to implement product requirements and validate features through automated and acceptance testing.

EDUCATION

University of California, Irvine
B.S. in Computer Science *GPA: 3.8/4.0* Sep 2024 – Jul 2028(Expected)

EXPERIENCE

ReDefine Space
Software Engineering Intern | Remote May 2026 – Sep 2026
CyberFC Sports Management and Analysis Platform (Football)
Technologies: React, TypeScript, FastAPI, PostgreSQL, GitLab, Python

- Developed a multi-role football club management and analysis platform through AI-assisted development, with modules of authentication, role-based permissions, club and team management, player profiles, and parent-child accounts.
- Built training and scheduling workflows covering RSVP and leave requests, attendance tracking, training logs, notifications, and role-specific views.
- Implemented competition and match-management features, including opponent records, team rosters, match snapshots, and a drag-and-drop formation editor.
- Created a video-analysis interface with large-file uploads, HLS playback, synchronized event timelines, action filtering, video annotation, clip generation, and 0.5×–3× playback controls.
- Used AI-assisted workflows during requirements analysis, implementation, test generation, and debugging; maintained 530+ automated tests and pre-commit checks for coverage, type checking, and linting.

PROJECTS

Geographic Data Management GUI with SQLite Mar 2025 – Jun 2025
Technologies: Python, Tkinter, SQLite

- Developed a desktop application managing 4,000+ hierarchical geographic records across 3 levels (continent, country, region) through an interactive GUI.
- Built an SQLite data model supporting CRUD operations with input validation and referential integrity across 3 tables.
- Designed a Tkinter-based interface supporting search, insert, and update operations across multiple geographic fields.
- Integrated transaction and exception handle to maintain data consistency and prevent data loss during failed operations.

Distributed Alert Propagation Simulator Mar 2025 – Jun 2025
Technologies: Python, OOP, Simulated Networking

- Designed an event-driven peer-to-peer simulator for modeling alert propagation and cancellation across user-defined network topologies.
- Modeled network nodes with unique identifiers, propagation relationships, and configurable transmission delays to simulate asynchronous communication.
- Implemented time-ordered message propagation with per-node cancellation tracking to prevent duplicate cancellation forwarding.
- Supported synchronized alert cancellation using unique message identifiers and propagation delays across large simulated network configurations.

Technical Skills:

- Programming Languages: Python, Java, SQL, C++
- Tools: Git, GitLab, GitHub
- Databases: SQLite
